

MEILANI

Veterinary Report by Embark

embarkvet.com

Test Date: March 7th, 2025

Customer-supplied information

Owner Name: Clarissa Wilstead

Dog Name: Meilani

Sex: Female

Date of birth: n/a

Breed type: N/A

Breed: N/A

Breed registration: N/A

Microchip: N/A

Genetic summary

Genetic breed identification:

Aussiedoodle (7.0% unresolved)

Predicted adult weight: **19 lbs**

Calculated from 17 size genes.

Breed mix:

Trace breeds:

- Maltese
- Cocker Spaniel

Karyogram (Chromosome painting)

Health Report

How to interpret Meilani's genetic health results:

If Meilani inherited any of the variants that we tested, they will be listed at the top of the Health Report section, along with a description of how to interpret this result. We also include all of the variants that we tested Meilani for that we did not detect the risk variant for.

A genetic test is not a diagnosis

This genetic test does not diagnose a disease. Please talk to your vet about your dog's genetic results, or if you think that your pet may have a health condition or disease.

Summary

Of the 274 genetic health risks we analyzed, we found 3 results that you should learn about.

Increased risk results (1)

Hereditary Cataracts

Notable results (2)

ALT Activity

Copper Toxicosis (Attenuating)

Clear results

Breed-relevant (20)

Other (250)

Health Report

BREED-RELEVANT RESULTS

Research studies indicate that these results are more relevant to dogs like Meilani, and may influence her chances of developing certain health conditions.

 Hereditary Cataracts (HSF4 Exon 9, Australian Shepherd Variant)	Increased risk
 Canine Multifocal Retinopathy, cmr1 (BEST1 Exon 2)	Clear
 Collie Eye Anomaly (NHEJ1)	Clear
 Craniomandibular Osteopathy, CMO (SLC37A2)	Clear
 Day Blindness (CNGB3 Deletion, Alaskan Malamute Variant)	Clear
 Degenerative Myelopathy, DM (SOD1A)	Clear
 GM2 Gangliosidosis (HEXB, Poodle Variant)	Clear
 Hereditary Ataxia (PNPLA8, Australian Shepherd Variant)	Clear
 Intervertebral Disc Disease (Type I) (FGF4 retrogene - CFA12)	Clear
 Junctional Epidermolysis Bullosa (LAMB3 Exon 11, Australian Shepherd Variant)	Clear
 Multiple Drug Sensitivity (ABCB1)	Clear
 Neonatal Encephalopathy with Seizures, NEWS (ATF2)	Clear
 Neuronal Ceroid Lipofuscinosis 6, NCL 6 (CLN6 Exon 7, Australian Shepherd Variant)	Clear
 Neuronal Ceroid Lipofuscinosis 8, NCL 8 (CLN8, Australian Shepherd Variant)	Clear
 Osteochondrodysplasia (SLC13A1, Poodle Variant)	Clear
 Primary Ciliary Dyskinesia, PCD (STK36, Australian Shepherd Variant)	Clear
 Progressive Retinal Atrophy, prcd (PRCD Exon 1)	Clear
 Urate Kidney & Bladder Stones (SLC2A9)	Clear

Health Report

BREED-RELEVANT RESULTS

 Von Willebrand Disease Type I, Type I vWD (VWF)	Clear
 Xanthine Urolithiasis (XDH, Mixed Breed Variant)	Clear
 β -Mannosidosis (MANBA Exon 16, Mixed-Breed Variant)	Clear

Health Report

OTHER RESULTS

Research has not yet linked these conditions to dogs with similar breeds to Meilani. Review any increased risk or notable results to understand her potential risk and recommendations.

 ALT Activity (GPT)	Notable
 Copper Toxicosis (Attenuating) (ATP7A, Labrador Retriever)	Notable
 2-DHA Kidney & Bladder Stones (APRT)	Clear
 Acral Mutilation Syndrome (GDNF-AS, Spaniel and Pointer Variant)	Clear
 Alaskan Husky Encephalopathy (SLC19A3)	Clear
 Alaskan Malamute Polyneuropathy, AMPN (NDRG1 SNP)	Clear
 Alexander Disease (GFAP)	Clear
 Anhidrotic Ectodermal Dysplasia (EDA Intron 8)	Clear
 Autosomal Dominant Progressive Retinal Atrophy (RHO)	Clear
 Bald Thigh Syndrome (IGFBP5)	Clear
 Bernard-Soulier Syndrome, BSS (GP9, Cocker Spaniel Variant)	Clear
 Bully Whippet Syndrome (MSTN)	Clear
 Canine Elliptocytosis (SPTB Exon 30)	Clear
 Canine Fucosidosis (FUCA1)	Clear
 Canine Leukocyte Adhesion Deficiency Type I, CLAD I (ITGB2, Setter Variant)	Clear
 Canine Leukocyte Adhesion Deficiency Type III, CLAD III (FERMT3, German Shepherd Variant)	Clear
 Canine Multifocal Retinopathy, cmr2 (BEST1 Exon 5, Coton de Tulear Variant)	Clear
 Canine Multifocal Retinopathy, cmr3 (BEST1 Exon 10 Deletion, Finnish and Swedish Lapphund, Lapponian Herder Variant)	Clear

Increased risk result

Hereditary Cataracts

Meilani inherited one copy of the variant we tested for Hereditary Cataracts, Early-Onset Cataracts, Juvenile Cataracts
Meilani is at increased risk for Hereditary Cataracts

How to interpret this result

Meilani has one copy of a variant in the HSF4 gene that is thought to cause juvenile cataracts in the Australian Shepherd. variants in HSF4 have been reported in humans with juvenile cataracts; two variants have been identified in dogs. Please consult with your veterinarian regarding further diagnostics and a treatment plan for Meilani.

What is Hereditary Cataracts, Early-Onset Cataracts, Juvenile Cataracts?

Cataracts are the result of a progressive disease of the lens. The lens is normally a transparent structure of precisely organized fibers that lives in the pupil and focuses light. Cataracts cause the lens fibers to become disordered and turns the lens into a milky blue color. The lens is no longer transparent, light fails to reach the retina, and blindness is the end result. With this genetic mutation, dogs can develop cataracts at only a few weeks to months of age.

When signs & symptoms develop in affected dogs

While cataracts are typically a disease of the aged dog and can be associated with other eye diseases (these would be termed secondary cataracts), mutations in the HSF4 gene cause cataracts to form at an accelerated rate in comparatively young dogs (approximately 2-7 years of age).

Signs & symptoms

Affected dogs will first show a cloudy haze in their pupil that becomes progressively more milky blue to crystalline in appearance. Vision will become progressively worse, and dogs may start bumping into furniture, be more hesitant on steps, and run into walls or doorways.

How vets diagnose this condition

Veterinarians will examine your dog's eyes, and may use a light or lens to assist in the diagnosis. Please note that there are other ocular diseases that are commonly mistaken for cataracts so be sure to have your dog evaluated by a veterinarian.

How this condition is treated

Surgical correction by a veterinary ophthalmologist is currently the only treatment available to restore your dog's vision. The other alternative is careful monitoring and lifestyle changes to make your dog's blindness more manageable.

Actions to take if your dog is affected

- The best care you can provide your dog is seeking the expert opinion of your veterinarian for an accurate diagnosis and determining whether or not a specialty consult for surgery is required.

ALT Activity

Meilani inherited one copy of the variant we tested for Alanine Aminotransferase Activity

Why is this important to your vet?

Meilani has one copy of a variant associated with reduced ALT activity as measured on veterinary blood chemistry panels. Please inform your veterinarian that Meilani has this genotype, as ALT is often used as an indicator of liver health and Meilani is likely to have a lower than average resting ALT activity. As such, an increase in Meilani's ALT activity could be evidence of liver damage, even if it is within normal limits by standard ALT reference ranges.

What is Alanine Aminotransferase Activity?

Alanine aminotransferase (ALT) is a clinical tool that can be used by veterinarians to better monitor liver health. This result is not associated with liver disease. ALT is one of several values veterinarians measure on routine blood work to evaluate the liver. It is a naturally occurring enzyme located in liver cells that helps break down protein. When the liver is damaged or inflamed, ALT is released into the bloodstream.

How vets diagnose this condition

Genetic testing is the only way to provide your veterinarian with this clinical tool.

How this condition is treated

Veterinarians may recommend blood work to establish a baseline ALT value for healthy dogs with one or two copies of this variant.

Copper Toxicosis (Attenuating)

Meilani inherited one copy of the variant we tested for Copper Toxicosis (Attenuating)

Why is this important to your vet?

Meilani has a genotype at the ATP7A gene that modifies and may help mitigate some of the symptoms from dogs with variants at ATP7B (<https://my.embarkvet.com/members/results/health/condition/140102?i=63>). This variant is not associated with an increased risk of any disease. As this variant resides on the X- chromosome, male dogs with one copy of the variant are better protected from copper accumulation due to the ATP7B variant than female dogs with one copy of the variant.

What is Copper Toxicosis (Attenuating)?

The ATP7A variant is considered beneficial and may be best described as a helpful modifier of the harmful copper toxicosis variant ATP7B (<https://my.embarkvet.com/members/results/health/condition/140102?i=63>). The ATP7A variant may help mitigate some of the symptoms of dogs with variants at ATP7B. Dogs with the ATP7A variant have not been observed to have any beneficial or harmful complications if they have two copies of the normal ATP7B variant.

When signs & symptoms develop in affected dogs

A variant in this gene may delay or have no effect on the onset of clinical signs of copper toxicosis in dogs with the ATP7B (<https://my.embarkvet.com/members/results/health/condition/140102?i=63>) variant. If your dog has the ATP7B variant, please read more about the age of onset on the ATP7B page.

How vets diagnose this condition

No diagnostics are required for this variant. If your dog has the ATP7B (<https://my.embarkvet.com/members/results/health/condition/140102?i=63>) variant, please read what diagnostics may be considered on the ATP7B page.

How this condition is treated

No treatment is required for this variant. If your dog has the ATP7B (<https://my.embarkvet.com/members/results/health/condition/140102?i=63>) variant, please read the available treatment on the ATP7B page.

Actions to take if your dog is affected

- No actions are required for dogs with this variant. If your dog has the ATP7B (<https://my.embarkvet.com/members/results/health/condition/140102?i=63>) variant, please read what actions you can take on the ATP7B page.

Genetic Diversity and Inbreeding

Coefficient of Inbreeding (COI)

Genetic Result: 0%

Our genetic COI measures the proportion of your dog's genome (her genes) where the genes on the mother's side are identical by descent to those on the father's side. The higher your dog's coefficient of inbreeding (the percentage), the more inbred your dog is.

Your Dog's COI

This graph represents where your dog's inbreeding levels fall on a scale compared to both dogs with a similar breed makeup to her (the blue bars) and all purebred dogs (the grey line).

Genetic Diversity and Inbreeding

More on the Science

Embark scientists, along with our research partners at Cornell University, have shown the impact of inbreeding on longevity and fertility and developed a state-of-the-art, peer-reviewed method for accurately measuring COI and predicting average COI in litters.

About Embark

Embark Veterinary is a canine genetics company offering research-grade genetic tests to pet owners and breeders. Every Embark test examines thousands of genetic markers, and provides results for over NaN genetic health conditions, breed identification, clinical tools, and more.

Embark is a research partner of the Cornell University College of Veterinary Medicine and collaborates with scientists and registries to accelerate genetic research in canine health. We make it easy for customers and vets to understand, share and make use of their dog's unique genetic profile to improve canine health and happiness.
